Project Design Phase

Problem – Solution Fit Template

Date	**29-09-2026**
Project Name	**Medical Diagnosis Center by Service Portal (ServiceNow)**
Maximum Marks	**4 Marks**

Problem–Solution Fit Summary Problem:

Medical diagnostic test requests can involve multiple manual activities, including collecting patient information, selecting diagnostic tests, creating records, processing requests, updating statuses, and communicating updates to users. These manual activities can lead to delays, repetitive work, and limited visibility into the request status.

Solution:

A centralized Medical Diagnosis Center by Service Portal in ServiceNow provides a structured and automated platform for submitting and managing diagnostic test requests. The solution uses the Service Portal, Service Catalog, Catalog Variables, UI Policies, ServiceNow Tables, and Flow Designer to automate request processing and record management.

Value Proposition:

A standardized and automated diagnostic-request process that simplifies test submission, improves information accuracy and request visibility, reduces repetitive manual work, and provides timely communication throughout the request lifecycle. The project specifically uses Service Portal submission, dynamic form behavior, automated record creation, workflow automation, status updates, and email notifications to streamline the management and fulfillment of medical diagnostic test requests.
