Planning Logic

Date	**29-09- 2026**
Project Name	**Medical Diagnosis Centre Management System in ServiceNow**
Maximum Marks	**2 Marks**

Planning Logic

The planning logic defines the step-by-step approach used to design and implement the Medical Diagnosis Centre Management System in ServiceNow. It ensures that the project progresses systematically from identifying the requirements of a diagnosis centre to managing patient requests, appointments, diagnostic tests, reports, and notifications through an automated workflow.

Step	Planning Logic
1. Identify Need	Identify problems in the existing medical diagnosis centre process, such as manual patient registration, appointment handling, test requests, and report management.

2. Define Requirements	Determine the required patient information, appointment details, diagnostic tests, medical records, approvals, status updates, and notifications.
3. Design Request Form	Create the appropriate ServiceNow catalog item/request form and configure variables required for patient and diagnostic information.
4. Create Data Structure	Create the required ServiceNow tables and fields to store patient, appointment, diagnostic test, and report information.
5. Automate Workflow	Build the workflow usingFlow Designer to automate the movement of requests from registration/appointment through diagnosis and report generation.
6. Assign Diagnostic Test	Assign the requested diagnostic test to the appropriate medical/laboratory staff and update the request status.
7. Process Diagnosis	Record the test/diagnosis details and update the patient's request or record with the relevant results.
8. Notify Users	Send notifications to patients and concerned staff regarding appointment confirmation, test status, report availability, and other important updates.

Step	Planning Logic
9. Update & Close	Update the diagnosis request with the final report/status and close the request after the diagnostic process is completed.
10. Test & Validate	Test the complete workflow using sample patient requests to verify forms, records, automation, notifications, and status updates.

Planning Logic Flow

Identify Problem → Define Requirements → Design Request Form → Create Data Structure → Automate Workflow → Assign Diagnostic Test → Process Diagnosis → Notify Users → Update & Close → Test & Validate

Planning Logic

The planning logic defines the step-by-step approach used to design and implement the Medical Diagnosis Centre Management System in ServiceNow. Each step ensures smooth flow from patient registration and appointment booking to diagnosis, report generation, notification, and closure.

Step	Planning Logic Description
1. Identify Need	Identify problems in the existing medical diagnosis centre process.
2. Define Requirements	Determine patient information, appointments, diagnostic tests, reports, approvals, and notifications required.
3. Design Request Form	Create the ServiceNow request/catalog form and configure required patient and diagnstic variables.
4. Create Data Structure	Create the required tables and fields to store patient, appointment, test, and report information.
5. Automate Workflow	Build the Flow Designer workflow to process diagnosis requests automatically.
6. Assign Diagnostic Test	Assign the requested test to the appropriate medical/laboratory staff and manage the test status.
7. Process Diagnosis	Record diagnostic test details and update the patient's request with the diagnosis/results.
8. Notify Users	Send notifications about appointment confirmation, test status, report availability, and updates.
9. Update & Close	Update the request with the final report/status and close it after completion.
10. Test & Validate	Test the complete workflow using sample patient requests and verify each stage.

Planning Logic Flow
