Customer Journey map

The Customer Journey Map illustrates the end-to-end journey of a patient submitting and tracking a diagnostic test request through the Medical Diagnosis Center Service Portal. You can use the generated map above in your documentation.

Journey Stages

1. **Need Identification– The patient identifies a requirement for a diagnostic test, such as a doctor-referred test, a routine health checkup, or a self-requested screening.**
2. **Request Submission– The patient accesses the ServiceNow portal, selects the required diagnostic test from the service catalog, provides the necessary details (prescription, insurance, preferred slot), and submits the request.**

3. Validation & Approval– The submitted request is validated against prescription and insurance rules through the configured workflow and routed for approval.
4. Request Fulfillment – Once approved, the request is assigned to the diagnostic/lab team, the sample is collected or the test is scheduled, and the required record/task is created.
5. Notification & Updates – Patients and doctors receive updates regarding approval, sample collection, processing, and report readiness through notifications.
6. Request Closure – After the report is generated and delivered, the request is completed and closed, with optional feedback collection.

This journey reflects the project's intended flow of self-service booking → automated validation → approval → fulfillment → notifications → closure.
