Project Design Phase-II

Data Flow Diagram & User Stories

1. Data Flow Diagram (DFD)

The DFD represents how a network request moves through the Automated Network Request Management system in ServiceNow—from submission by the requester to approval, record creation, fulfillment, notification, and closure.

DFD Flow

Medical Project – Data Flow / Workflow

Patient → Submit Diagnostic Test Request → Validate Test Details → Create Diagnostic Test Record → Process Test → Update Lab Report → Send Notifications & Close Request

The main data stores represented are:

- **D1 – Medical Service Catalog: Stores diagnostic test catalog items and request variables.**
- **D2 – Diagnostic Test Request: Stores submitted patient and test-request information.**

- **D3 – Diagnostic Test Records:** Stores test-related records, assignments, and processing details.
- **D4 – Notification Log:** Records notification information sent to patients and medical staff.

The workflow includes request validation, approval/processing handling, test assignment, result updates, and notifications. This reflects the project's ServiceNow implementation using Get Catalog Variables, Create Record, Ask for Approval, Flow Logic, Send Email, and Update Record

---

1. User Stories

User Story ID	User Story	Priority
US01	As a patient , I want to request a diagnostic test through the medical service portal so that I can easily access the required medical testing service.	High
US02	As a patient , I want to provide all required patient and test details through a structured form so that my request can be processed correctly.	High
US03	As a system, I want to validate the diagnostic test request and route it for processing/approval so that only valid requests are handled.	High
US04	As a medical staff member, I want to review and approve diagnostic test requests so that authorized tests can proceed.	High
US05	As a system, I want to automatically create diagnostic test records/tasks after approval so that laboratory staff can begin processing without unnecessary manual work.	Medium
US06	As a laboratory technician, I want to view assigned diagnostic test tasks and update their progress so that tests can be completed efficiently.	High
US07	As a patient, I want to track the status of my diagnostic test request so that I know whether it is submitted, in progress, completed, or closed.	High
US08	As a system , I want to send notifications at important stages so that patients and medical staff remain informed about test progress and results.	Medium
US09	As a medical administrator, I want to view reports and analytics so that I can monitor test requests, processing time, workload, and service performance.	Medium

2. Design Goal

The overall design aims to provide a seamless, transparent, and automated experience for requesting, approving, processing, and tracking diagnostic tests. The system reduces repetitive manual work for medical and laboratory staff while allowing patients to

submit requests, track test progress, and receive timely notifications about their diagnostic services and reports
