Solution Requirements

Date	**29-09-2026**
Project Name	**Medical Diagnosis Center by Service Portal(ServiceNow)**
Maximum Marks	**4 Marks**

The Medical Diagnosis Center by Service Portal (ServiceNow) solution requires a centralized and automated platform for submitting, processing, managing, and tracking medical diagnostic test requests. The requirements are based on the project's objective of simplifying diagnostic test requests, improving visibility, automating record creation and notifications, and providing users with an organized way to manage diagnostic services.

1.Functional Requirements

ID	Requirement	Description
FR01	**Diagnostic Test Submission**	**The system shall allow users to submit medical diagnostic test requests through the ServiceNow Service Portal.**
FR02	**Test Request Form**	**The system shall capture required information such as patient details, diagnostic test type, preferred date, contact information, and other relevant medical test details.**
FR03	**Patient Information**	**The system shall capture patient details such as patient name, email ID, phone number, and other required information.**
FR04	**Conditional Fields**	**The system shall display relevant fields based on the user's selections, such as displaying additional testrelated information when a specific diagnostic test is selected.**
FR05	**Diagnostic Request Record Creation**	**The system shall automatically create a diagnostic test request record after the Service Portal request is submitted.**
FR06	**Request Management**	**The system shall allow authorized users or medical staff to review, process, and update diagnostic test requests according to their status.**
FR07	**Task/Record Assignment**	**The system shall generate or assign the required diagnostic task/record to the appropriate staff or department for processing.**

ID	Requirement	Description
FR08	Test Request Fulfillment	The medical/diagnostic team shall be able to process the request, update test details, and complete the diagnostic request.
FR09	Notifications	The system shall send email notifications to relevant users or teams during important stages of the diagnostic request lifecycle.
FR10	Record Updates	The workflow shall automatically update the diagnostic request record according to the processing and completion status.

These requirements correspond to the implemented Flow Designer sequence of: Get Catalog Variables → Create Diagnostic Record → Flow Logic → Send Email → Update Record

---

2. Non-Functional Requirements

ID	Requirement	Description
NFR01	Usability	The Service Portal should provide a simple, clear, and userfriendly interface for submitting medical diagnostic test requests.
NFR02	Automation	The system should minimize manual activities by automating diagnostic record creation, request processing, status updates, and notifications where applicable.
NFR03	Reliability	Diagnostic requests should be processed consistently according to the configured ServiceNow workflow and business rules.
NFR04	Transparency	Users and authorized medical/administrative staff should have visibility into the status and progress of diagnostic requests.
NFR05	Efficiency	The solution should reduce processing delays, repetitive manual work, and unnecessary communication between users and diagnostic staff.
NFR06	Scalability	The solution should support different types of diagnostic tests and additional test-related variables as the requirements grow.
NFR07	Maintainability	Catalog items, variables, UI policies, tables, Service Portal pages, and workflows should be configurable and maintainable within ServiceNow.

---

3. Technology Requirements

The project uses the following ServiceNow technologies and components:

- **ServiceNow Platform**
- **Service Portalfor submitting and accessing diagnostic test requests**
- **Service Catalog for creating the medical diagnostic test request**
- **Catalog Variables for collecting patient and diagnostic test information**
- **Catalog UI Policies for dynamic form behavior and conditional fields**
- **ServiceNow Tables for storing patient and diagnostic test information**
- **Flow Designerfor automating the diagnostic request process**
- **ServiceNow Records/Tasks for managing submitted diagnostic requests**
- **Email Notifications for communicating request status and updates**
- **ServiceNow Reporting/Dashboards for monitoring diagnostic requests and their status**

Requirement Summary

The solution must provide an end-to-end automated medical diagnostic request process that allows users to submit diagnostic test requests through the Service Portal, captures the required patient and test information, automatically creates diagnostic records, routes requests for processing, updates request status, and keeps users informed through notifications.

This supports the project's goal of providing a simpler diagnostic request experience, improved request visibility, faster processing, and reduced manual effort within the ServiceNow platform.
