User Acceptance Testing (UAT)

User Acceptance Testing is performed to verify that the Medical Diagnosis Center by Service Portal (ServiceNow) meets the expected business requirements and provides a simple, reliable experience for users submitting and managing medical diagnostic test requests.

UAT validates the diagnostic request submission process, patient information capture, record creation, request processing, notifications, and status updates.

Note: The test results should be updated according to the actual testing performed in the ServiceNow application.

UAT Objectives

- **Verify that users can successfully submit medical diagnostic test requests through the Service Portal.**
- **Confirm that all required patient and diagnostic test information is captured.**
- **Verify that catalog variables and UI policies function correctly.**
- **Confirm that diagnostic request records are created correctly.**
- **Verify that diagnostic requests can be processed and updated.**
- **Check that email notifications are generated at appropriate stages.**
- **Verify that request status updates and completion work correctly.**
- **Ensure that the Service Portal provides a simple and convenient user experience.**
- **Identify defects and collect user feedback.**
- **Confirm that the solution satisfies the project requirements.**

UAT Test Cases

ID	Test Case	Expected Result
UAT-01	Open Medical Diagnostic Test Catalog	The diagnostic test catalog item opens successfully in the Service Portal.
UAT-02	Fill Diagnostic Test Request Form	Required patient and diagnostic test information is captured correctly.

ID	Test Case	Expected Result
UAT-03	Submit Diagnostic Test Request	The diagnostic test request is submitted successfully.
UAT-04	Diagnostic Record Creation	A diagnostic request record is created correctly in the appropriate ServiceNow table.
UAT-05	Catalog UI Policies	Fields behave according to the selected diagnostic test or other form conditions.
UAT-06	Request Processing	The submitted diagnostic request is available for review and processing by authorized users.
UAT-07	Update Diagnostic Request	Authorized users can update relevant diagnostic request information.
UAT-08	Email Notification	Appropriate email notifications are generated for configured request events.
UAT-09	Request Status Update	The diagnostic request status is updated correctly during processing.
UAT-10	Complete Diagnostic Request	The diagnostic request can be marked as completed successfully.
UAT-11	Service Portal Pages	Diagnostic information and request details are displayed correctly on the configured Service Portal pages.
UAT-12	End-to-End Workflow	The complete diagnostic request lifecycle works correctly, from submission to completion.

UAT Process

Prepare Test Cases → Execute Tests → Collect User Feedback → Identify Issues → Fix and Retest → Obtain Final Sign-off

The testing process begins by preparing test scenarios based on the project requirements. Users then execute the test cases in the ServiceNow application. Any identified issues are documented, corrected, and tested again before final acceptance.

Acceptance Criteria

The Medical Diagnosis Center by Service Portal (ServiceNow) is considered acceptable when:

- All critical diagnostic request scenarios work correctly.
- Patient and diagnostic test information is captured accurately.
- Catalog variables and UI policies behave as expected.
- Diagnostic request records are created correctly.
- Request processing and status updates function properly.
- Configured email notifications are generated correctly.
- Diagnostic requests can be completed successfully.
- Major defects are resolved.
- Users can navigate and use the Service Portal conveniently.
- Stakeholders provide final approval.

UAT Summary

UAT ensures that the Medical Diagnosis Center provides a functional and user-friendly platform for submitting and managing diagnostic test requests. Successful testing confirms that the implemented ServiceNow components work together to support accurate information capture, automated record creation, efficient request processing, and improved visibility throughout the diagnostic request lifecycle.
