Problem Statement

In modern healthcare environments, managing medical diagnostic services such as patient registration, diagnostic test requests, test processing, and laboratory reports can involve multiple manual steps. Traditional diagnostic service management can result in delays in processing requests, incomplete patient information, difficulty tracking test status, repetitive administrative work, and limited visibility into laboratory reports.

The proposed Medical Diagnosis Center by Service Portal (ServiceNow) addresses these challenges by providing a centralized self-service mechanism for accessing diagnostic services and submitting medical test requests. The system captures the required patient and diagnostic information through a structured service portal, stores the information in centralized ServiceNow tables, automates the processing of requests, and provides access to diagnostic status and laboratory report information.

Key Problems Identified

1. Manual Patient and Request Processing

Patient registration and diagnostic test requests may require several manual activities. This increases processing time and administrative effort and may lead to data-entry errors.

2. Difficulty in Diagnostic Test Requests

Patients or users may not have a simple and centralized method for selecting and requesting the required diagnostic tests. A structured Service Portal can simplify the request process.

3. Incomplete or Inconsistent Information

Diagnostic requests submitted without a standardized form may contain missing or inconsistent patient and test information. This can create difficulties during test processing.

4. Lack of Request Visibility

Patients and authorized staff may have limited visibility into the current status of a diagnostic test request. This can make it difficult to determine whether a test is pending, being processed, or completed.

5. Difficulty Managing Laboratory Reports

Maintaining laboratory reports manually can make it difficult to associate reports with the correct patient and diagnostic request and can make report access less convenient.

6. Repetitive Administrative Work

Medical and administrative staff may spend considerable time performing repetitive activities such as entering records, updating request information, and managing diagnostic-related data. These activities can be reduced through ServiceNow automation.

7. Limited Standardization

Without a centralized system, patient details, diagnostic test information, requests, and laboratory reports may be maintained in different places. This makes information management more difficult.

8. Communication and Notification Gaps

Users may not receive timely information regarding the submission, processing, status changes, or availability of diagnostic reports when communication is handled manually.

Problem Statement Summary:

To develop a ServiceNow-based Medical Diagnosis Center through Service Portal that simplifies diagnostic service access and request submission, standardizes patient and test information, automates repetitive processing activities, manages laboratory reports, and provides better visibility throughout the diagnostic request lifecycle.

The proposed solution uses ServiceNow Service Portal, Service Catalog, custom tables, Flow Designer, UI Policies, Client Scripts, access controls, reports, and dashboards to provide a centralized and organized platform for managing medical diagnostic services.
